Authorization for this examiner's amendment was given in a telephone interview with Ted Fay (No. 48,504) on 05/20/10.

The application has been amended as follows:

- Please cancel Claims 3, 11-17, 20-23 and 30-33.
- Please amend Claims 1, 4, 5, 8, 9, 18, 19 and 25 as follows.
- Please add Claims 34 and 35 as follows.

1. **(Currently Amended)** A system for distributing authentication information to a remote device, comprising:

~~an authentication information store on a computer-readable memory having an authentication information store configured to store, prior to receipt of a seed request, authentication information comprising a plurality of seeds for a plurality of users; and~~

a data processor executable authentication system configured to:

receive from the remote device the seed request for one of the plurality of seeds, the seed request including identity information and a received access code;

authenticate the seed request if the identity information is associated with one of the plurality of users;

responsive to the authentication, retrieve the one of the plurality of seeds corresponding to the identity information from the authentication information store;

calculate a calculated access code using the retrieved seed;
determine whether the calculated access code matches the received access code; and
return the retrieved seed to the remote device if the calculated access code matches the received access code.
~~to receive from the remote device a request for authentication information comprising a seed for one of the plurality of users;~~
~~wherein the request comprises identity information for use in determining whether the request is from one of the plurality of users;~~
~~wherein the authentication system retrieves from the authentication information store, based on the identity information, the authentication information comprising the seed for the one of the plurality of users;~~
~~wherein the authentication information for the one of the plurality of users is present in the authentication information store prior to receipt of the request for authentication information;~~
~~wherein the retrieved authentication information is provided to the remote device for use in authenticating a user that is requesting remote access to a computer network;~~
~~wherein the seed in the retrieved authentication information is used by the remote device to generate access codes for gaining access to a computer network.~~

4. **(Currently Amended)** The system of claim 1, wherein the seed request comprises a Hypertext Transfer Protocol (HTTP) connection request.
5. **(Currently Amended)** The system of claim 1, wherein the seed request comprises a network password and a digital signature, and wherein the network password and digital signature are verified by the authentication system before the authentication information is provided to the remote device.
8. **(Currently Amended)** The system of claim 1, wherein the identity information in the seed request is used by the remote device for two-factor authentication.

9. (Currently Amended) The system of claim 8, wherein the identity information comprises a network password entered by the user of the remote device and a digital signature generated based on a transformation of at least a portion of the information in the seed request, a signature key, and a signature algorithm.

18. (Currently Amended) The system of claim 1, wherein the remote device uses the retrieved ~~seed authentication information~~ to gain access to a corporate local area network (LAN).

19. (Currently Amended) The system of claim 18, wherein two-factor authentication is used in the LAN to authenticate a user requesting remote access to the LAN, and wherein the retrieved ~~seed authentication information~~ is used in performing two-factor authentication in order to gain access to the LAN.

25. (Currently Amended) The system of claim 24, wherein the remote device stores the ~~authentication information~~ retrieved seed in a data store.

34. (New) A method for distributing authentication information to a remote device using an authentication system, the method implemented using a computer-readable memory having an authentication information store storing, prior to receipt of a seed request, a plurality of seeds for a plurality of users; the method comprising:

- receiving from the remote device, via a communication network, the seed request for one of the plurality of seeds, the seed request including identity information and a received access code;

- authenticating the seed request if the identity information is associated with one of the plurality of users;

- responsive to the authentication, retrieving the one of the plurality of seeds corresponding to the identity information from the authentication information store;

- calculating, by a computer, a calculated access code using the retrieved seed;

- determining, by the computer, whether the calculated access code matches the received access code; and

returning the retrieved seed to the remote device if the calculated access code matches the received access code.

35. (New) A non-transitory computer readable medium having an authentication information store storing, prior to receipt of a seed request, a plurality of seeds for a plurality of users, wherein the non-transitory computer readable medium further stores instructions comprising an authentication system which, when executed by a processor, implements a method for distributing authentication information to a remote device, the method comprising:

receiving from the remote device the seed request for one of the plurality of seeds, the seed request including identity information and a received access code;

authenticating the seed request if the identity information is associated with one of the plurality of users;

responsive to the authentication, retrieving the one of the plurality of seeds corresponding to the identity information from the authentication information store;

calculating a calculated access code using the retrieved seed;

determining whether the calculated access code matches the received access code; and

returning the retrieved seed to the remote device if the calculated access code matches the received access code.

2. The following is an examiner's statement of reasons for allowance: the amendments and/or arguments filed by the Applicant have been considered and are persuasive, in particular those found on pages 11-13 of the remarks filed on 02/12/10. Therefore, Claims 1, 2, 4-10, 18, 19, 24-29, 34 and 35 have been deemed allowable over the prior art of record.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
